

///// THE TROIKA, KUALA LUMPUR

Client - BRDB / Completed - 2010

With its seemingly impossibly slender blades of shear walls reaching more than 200m into the skies, the Troika sets new standards of excellence in Kuala Lumpur. An arrestingly stunning design by Foster+Partners that maximizes the interaction between architectural and structural expression. The modular precast concrete panels acting as permanent formwork as well as the ultimate facade of the shear walls yields an ingenious and ground breaking closed system which when combined with the flat slab floor plates tell a story of vertical and horizontal planes coming together in a simple and elegant way to form a sophisticated simplicity that is the structure of the award winning development.
