BRIEF INTRODUCTION TO WEB STRUCTURES

WEB STRUCTURES

Web Structures is an internationally-acclaimed civil, structural and geotechnical engineering consultancy delivering high quality solutions across the globe.

The company is a pioneer of "Fusion Engineering" - using cost efficiencies to redefine engineering excellence through true innovation and design – enabling groundbreaking architecture to become building reality.

Web Structures' diverse portfolio includes work on award-winning suspension bridges, luxury resort hotels, residential skyscrapers and complex commercial and industrial projects.

Web Structures' project partners include DP Architects, Foster + Partners, Zaha Hadid Architects, Conran & Partners, Adjaye Associates, Maki and Associates, UN Studio, RSH+P and Kengo Kuma & Associates.

Its high-quality design engineering places the practice and its talented team of professionals in the "Premier League" of international engineers, demonstrating an in-depth knowledge that continues to stretch the boundaries of existing engineering work practices.

This is why Web Structures' Fusion Engineering philosophy is recognised and utilised by some of the biggest and most acclaimed names in architecture, who have all called in Web Structures to work on cutting-edge and landmark projects.

Amongst these high-profile projects, Web Structures has carried out work on New York's Freedom Tower, utilising its specialist engineering and facade consultancy services 507 meters above ground level. One of Web Structures' current projects in Kuala Lumpur ranks amongst the world's ten tallest skyscrapers when completed.

The company is also working to ensure that tourist economies worldwide can grow and still protect the natural ecology.

Web Structures' three year project for international resort group Four Seasons' recently completed development in Seychelles has been hailed as proof that tourism can exist without harming the environment.

Web Structures also leads the field in its research work and was highly acclaimed for its discourse of "earthquake and seismic design of structures" in Malaysia after the tsunami-causing earthquake of December 2004.

Founded in 1996 with a staff of two, today Web Structures has a staff strength of over 100 talented experts working from offices in Singapore, Kuala Lumpur, London and Shanghai.
